To get a quick insight into a new dataset some folks like using the skimer package and its "skim()"

```
skimr::skim(candy)
```

Table 1: Data summary

Q4. What is the winpercent value for "Kit Kat"?

```
candy["Kit Kat","winpercent"]
```

```
[1] 76.7686
```

Q5. What is the winpercent value for "Tootsie Roll Snack Bars"?

```
candy["Tootsie Roll Snack Bars","winpercent"]
```

```
[1] 49.6535
```

Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset?

The variables that have a different scale is winpercent because is from 0 to 100 scale.

Q7. What do you think a zero and one represent for the candy$chocolate column?

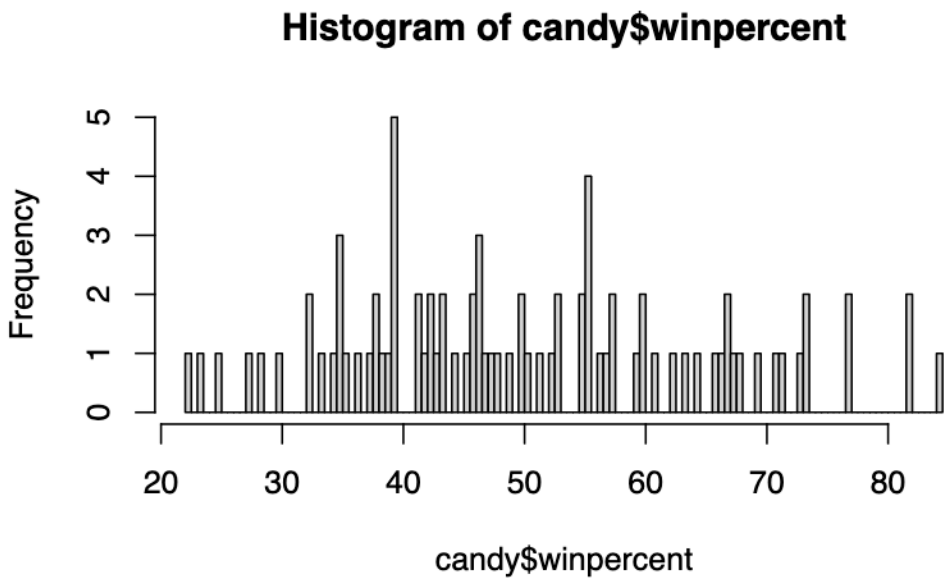
zero means its not chocolate and 1 means its chocolate. true or false

Looks like the 'winpercent' variable or column is measure on a different scale than everything else! i will need to scale my data before doing any analysis lie PCA etc.

Q8. Plot a histogram of winpercent values

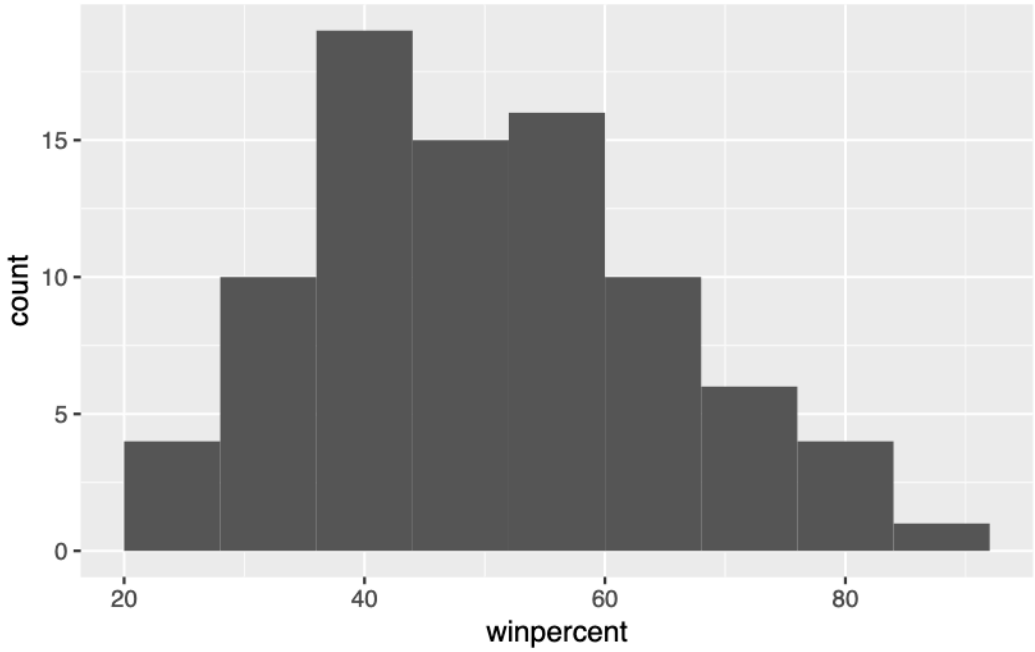
We can do this a few ways, e.g the "base" R 'hist()' function or with 'ggplot'

```
hist(candy$winpercent, breaks=100)
```



```
library(ggplot2)

ggplot(candy) +
  aes(winpercent) +
  geom_histogram(binwidth = 8)
```



```
  theme_bw()
```

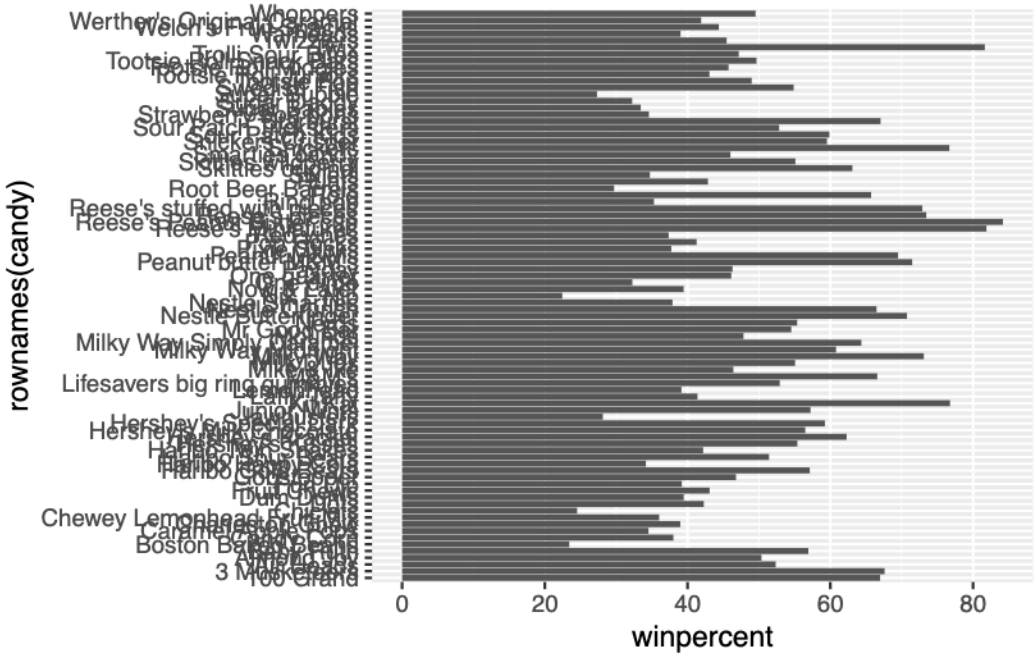
Q15. Make a first barplot of candy ranking based on winpercent values.

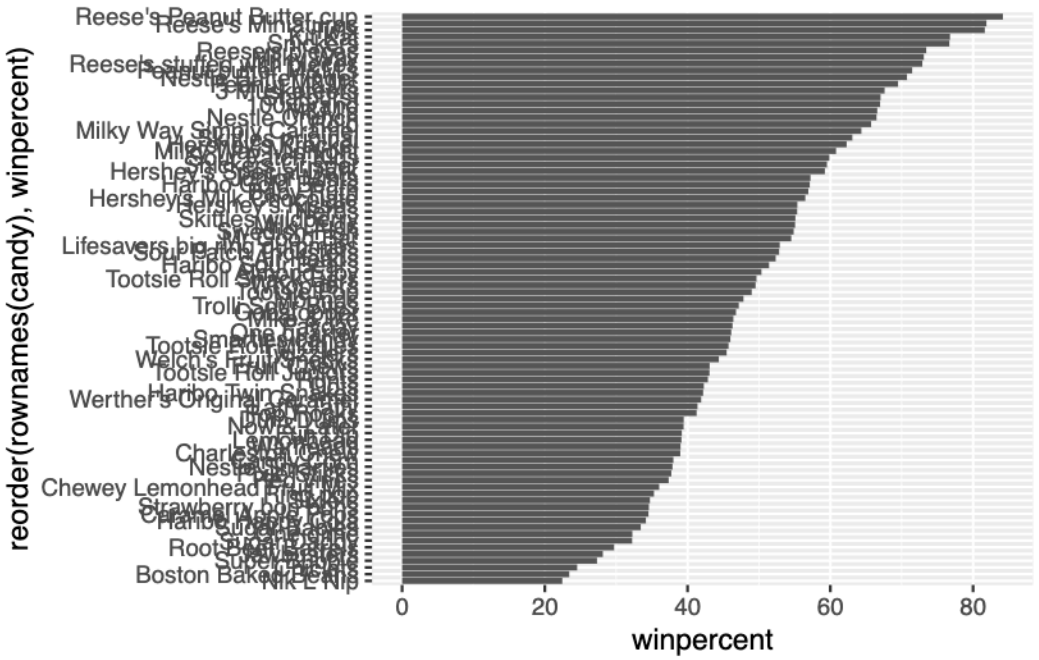
Let's do a barplot of winpercent values

```
ggplot(candy) +
  aes(winpercent, rownames(candy)) +
  geom_col()
```

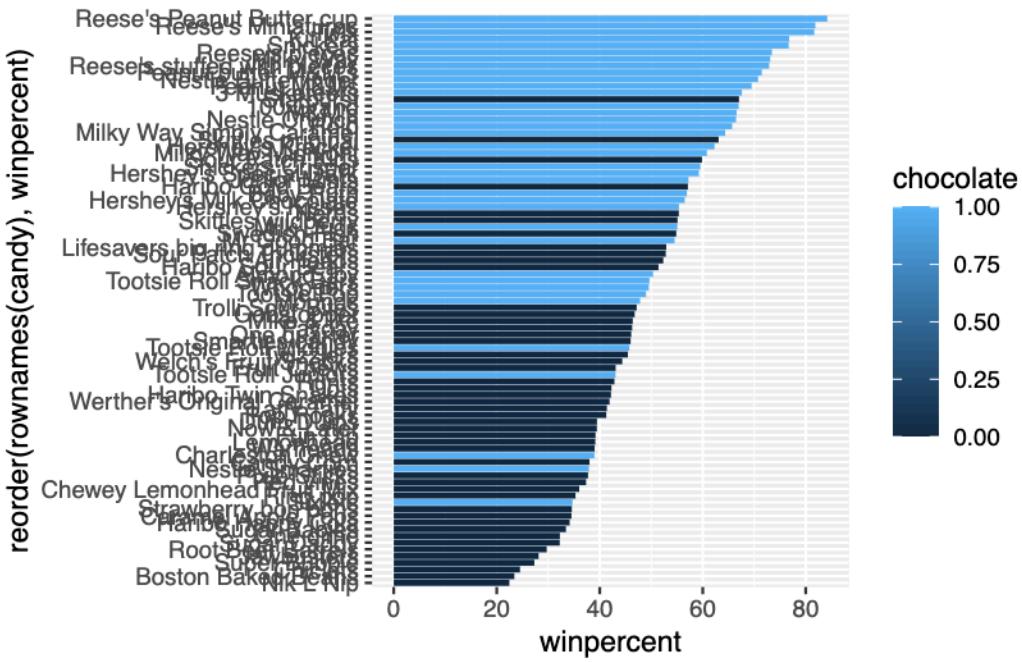


Q16. This is quite ugly, use the reorder() function to get the bars sorted by winpercent?

```
ggplot(candy) +
  aes(winpercent, reorder(rownames(candy), winpercent)) +
  geom_col()
```



```
ggplot(candy) +
  aes(x=winpercent,
      y=reorder(rownames(candy), winpercent),
      fill=chocolate) +
  geom_col()
```



I want a more custom color scheme where I can see both chocolate and bar and fruit etc. all from the plot. To do this we can roll our own color vector...

```
# Place holder color vector
mycols <- rep("black", nrow(candy))
mycols[as.logical(candy$chocolate)] <-"chocolate"
mycols[as.logical(candy$bar)] <-"brown"
mycols[as.logical(candy$fruity)] <-"pink"
mycols[ rownames(candy)== "Twix"] <- "blue"

mycols
```

```
 [1] "brown"     "brown"     "black"     "black"     "pink"      "brown"
 [7] "brown"     "black"     "black"     "pink"      "brown"     "pink"

```

```
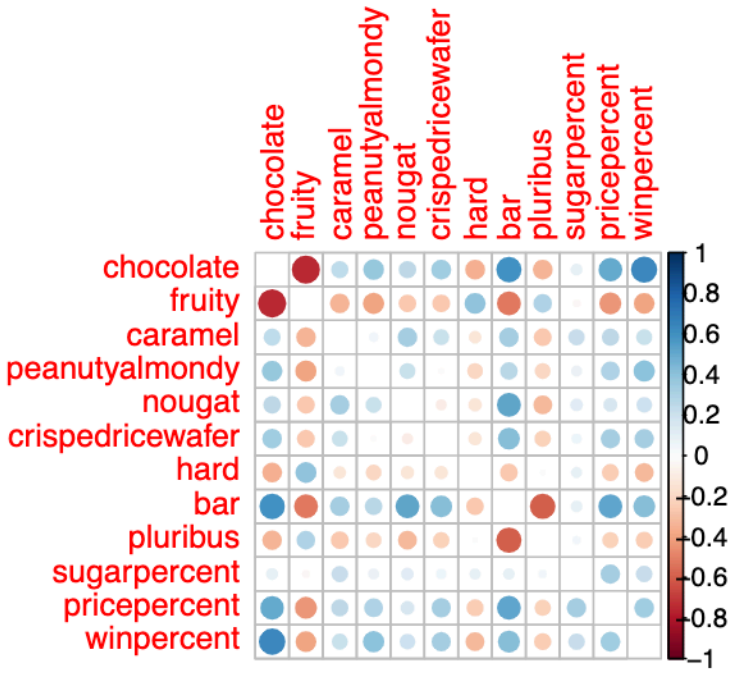
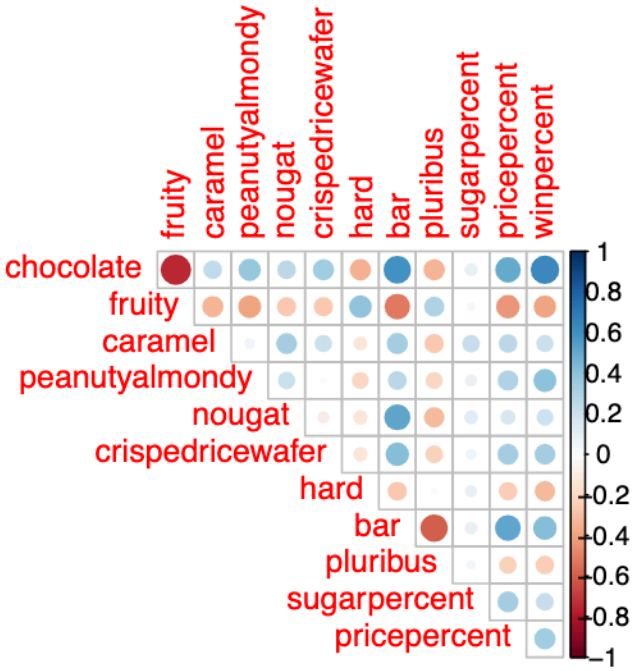
cij <- cor(candy)
corrplot(cij, diag = F)
```



```
cij <- cor(candy)
corrplot(cij, diag = F, type= "upper")
```



Q21. Make a barplot again with geom_col() this time using pricepercent and then improve this step by step, first ordering the x-axis by value and finally making a so called "dot chat" or "lollipop" chart by swapping geom_col() for geom_point() + geom_segment(). OPTIONAL

Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)?

`Chocolate and Fruit`

Q23. Similarly, what two variables are most positively correlated?

`winpercent and chocolate`

Let's make a nicer score plot with ggplot. Again I need a data.frame with all the stuff (PC results and candy data) for my plot as input

```
pc.results <- cbind(candy, pca$x)

ggplot(pc.results) +
  aes(PC1, PC2, label =rownames(pc.results)) +

Q24. What original variables are picked up strongly by PC1 in the positive direction? Do these make sense to you?

Most positive is fruity.
